Examiner

Jean E Lesperance

Art Unit

2674

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 14 March 2005.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 11-15, 17-20 and 28-35 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 11-15, 17-20 and 28-35 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 14 March 2005 is/are: a) ☐ accepted or b) ☒ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☒ None of:
- 1) ☒ Certified copies of the priority documents have been received.
 - 2) ☐ Certified copies of the priority documents have been received in Application No. _____.
 - 3) ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

1. The amendment filed on March 14, 2005 is entered and claims 11-15, 17-20 and 28-35 are pending.

Claim Rejections - 35 USC § 112

2. The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

Claims 11-15, 17-20 and 28-35 are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention. In independent claims 11, 13, 28 and 29, the limitation "a gradation level equal to or lower than a predetermined level" and "first, second, third dither coefficient pattern signal" are not described anywhere in the specification. Correction is required.

3. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claims 11-15, 17-20 and 28-35 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the

subject matter which applicant regards as the invention. In independent claims 11, 13, 28 and 29, the limitation "a gradation level equal to or lower than a predetermined level" and "first, second, third dither coefficient pattern signal" are indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. What is the predetermined level? It is not defined in the specification. What are the first, second and third dither coefficients? Correction is required.

For the purpose of this Office Action, the examiner assumes that: the claim limitation "first, second and third dither" is read as first, second and third dither values; the claim limitation "a gradation level equal to or lower than a predetermined level" is read as predetermined ratios.

Claim Rejections - 35 USC § 103

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 11, 12, 14, 30 and 34 are rejected under 35 U.S.C. 103(a) as being unpatentable over Ishida et al. (US Patent 6,069,609) in view of Sakano (US Patent # 5,144,456).

As to claim 11, Ishida et al. teaches an apparatus for processing a video signal comprising a pattern generator (dither pattern generator 13 shown in figure 1 0A) to generate a plurality of dither pattern signals, carrying positional data indicating locations

Art Unit: 2674

of dither coefficients, a coefficient generator to generate a dither coefficient signal carrying the dither coefficients arranged in a matrix (2x2 dither matrices, column 20, lines 51-57) for each gradation level of an input video signal (28 ranges within 256-shade grayscale shown in figure 18) in response to one of the pattern signal, and an adder (adder 12, figure 10A, column 10, line 50) to add the coefficient signal to the input video signal (column 12, lines 61-62), thus outputting a video signal to be supplied to the display panel (PDP 21 shown in figure 11), wherein the adder adds the coefficient signal to the input video signal at gradation levels equal to or lower than a predetermined level (optimum value of A according to 256-shade grayscale shown in figure 19, threshold for each dither pattern is zero to 10, column 12, lines 66-67).

Ishida et al teaches weighting ring applied to each dither coefficient (column 13, lines 57-65). An apparatus for processing a video signal (image processing device, abstract) comprising a generator (dither pattern generator 13 shown in figure 10A) to generate a plurality of dither coefficient signals, each coefficient signal carrying dither coefficients arranged in a matrix (2x2 dither matrices, column 20, lines 51-57); an adder (adder 12, figure 10A, column 10, line 50) to add one of the coefficient signals to signal components at predetermined gradation levels of the input video signal (256-shade grayscale as shown in figure 19), thus output a video signal. Ishida et al. does teach 8-bit input signal for each color RGB (column 8, lines 2-3, column 11, lines 28-29), and grayscale levels in figure 19, dither pattern generator 23 shown in figure 11 receiving RGB input signals but Ishida et al. fails to expressly teach a detector to detect color

Art Unit: 2674

gradation levels of an input video signal. However Ishida et al fails to expressly teach the lower the gradation level, and the larger the weighing.

Sakano teaches a relatively large weighting factor is given the gradation level of a pixel close to the pixel of concern, and a relatively small weighting factor is given the gradation level of a pixel far from the pixel of concern (column 7, lines 43-47).

It would have been obvious to a person of ordinary skill in the art at the time of the invention to utilize the weighted factor as taught by Sakano in the image processor disclosed by Ishida et al. because this would provide an image processing apparatus capable of eliminating a background contamination from a readout image signal without affecting a signal component of a real image contained in the readout image signal (column 1, lines 48-51).

As to claim 12, wherein each coefficient signal carrying positive and negative coefficients (+A and -A, figure 15), the sum total of the coefficients being zero (sum A-A-A+A is zero, figure 15).

As to claim 14, wherein weighting is applied to the dither coefficients carried by each pattern signal (figure 19 show optimum value of A depending on gray-scale levels). However, Ishida et al. fails to expressly teach the lower the gradation the larger the weighting. Note that Ishida et al. teaches dither value to deal with a shade that may easily flicker and lighting order of subframes (column 15, lines 36-39), that human eye senses flicker at low brightness levels, at high brightness levels, the subframes to be turned ON vary little (column 19, lines 7-10).

As to claim 30, Ishida et al. teaches the step of applying weighting to the dither coefficients carried by each pattern signal (figure 19 show optimum value of A depending on gray-scale levels), but fails to teach the lower the gradation, the larger the weighting. Note that Ishida et al. teaches dither value to deal with a shade that may easily flicker and lighting order of subframes (column 15, lines 36-39), that human eye senses flicker at low brightness levels, at high brightness levels, the subframes to be turned ON vary little (column 19, lines 7-10).

As for claim 34, Ishida et al. teach a frame is divided into six subframes SF1 to SF6 as explained with reference to FIG. 1. The lighting periods of the subframes SF1 to SF6 are determined according to powers of 2 as listed in Table 1. The lighting periods correspond to shades, or intensity or brightness levels, respectively.

Claim Rejections - 35 USC § 102

5. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claims 13, 15, 17-20, 28, 29, 31-33 and 35 are rejected under 35 USC 102 (e) as being unpatentable over Ishida et al. (US Patent # 6,069,609).

As to claim 13, Ishida et al. teaches an apparatus for processing a video signal comprising: a coefficient generator to generate a plurality of dither coefficient pattern signals (dither pattern generator shown in figure 10A) according to color gradation levels (8-bit input signal for each color RGB, column 8, lines 2-3, gray scale levels in figure 19), a selector (selector 32/34 shown in figure 27, column 17, lines 20-22) to select one of the dither coefficient from each pattern signal with respect to each dot matrix, an adjuster to adjust the dither coefficients carried by the output pattern signal so that the sum total of the dither coefficients is zero (since sum $A-A+A$ is zero , figure 15, column 11, lines 4-5, therefore adjuster to adjust the dither coefficients is inherent) and the dither pattern generator 13 selects one of the dither patterns prepared in advance (column 10, lines 47-49), an adder (adder 12, figure 10A, column 10, line 50) to add the dither coefficient-adjusted pattern signal to the input video signal, thus outputting a video signal carrying the data to be supplied to the display panel (PDP 21 shown in figure 11).

As to claim 15, wherein the selector selects one dither coefficient for each predetermined unit of the data carried by the video signal or according to locations of the pixels on the display panel selector selects one of the dither types, column 22, lines 50-51).

As to claim 17, wherein each pattern signal carries an even number of the coefficients addition of the coefficients in each of the two groups yielding zero when the coefficients are divided in the two groups (figure 15 shows groups $+A$ and $-A$).

As to claim 18, Ishida et al. fails to teach dither matrix wherein each pattern signal carries an odd number of the coefficients, the coefficient located at the center of the matrix being zero. However, since figure 15 shows the sum of dither coefficients being zero and Ishida et al. discloses that any matrix is employable (column 13, lines 1-2), it is inherent in the art, in case of a (n x m) matrix where n is different from m, to easily determine value of dither coefficient at the center of matrix to keep sum of all dither coefficients being zero.

As to claim 19, the apparatus according to claim 16, where n and m are equal to each other figure 15 where $n=m=2$).

As to claim 20, wherein each pattern signal carries the same number of the positive and the negative coefficients (figure 15 shows groups +A and -A).

As to claim 28, Ishida et al. teaches a method of processing a video signal comprising the steps of generating a plurality of dither pattern signals (dither pattern generator 13 shown in figure 10A generating dither pattern signals), each pattern signal carrying positional data indicating locations of dither coefficients on pixels arranged in a matrix on a display panel, generating a dither coefficient signal (2x2 dither matrices, column 20, lines 51-57) carrying the dither coefficients arranged in a matrix for each gradation level of an input video signal in response to one of the pattern signal (28 ranges within 256-shade grayscale shown in figure 18), adding (adder 12, figure 10A, column 10, line 50) the dither coefficient signal to the input video signal (column 12, lines 61-62), thus outputting a video signal to be supplied to the display panel (PDP 21 shown in figure 11) wherein the addition step comprises the step of adding the

coefficient signal to the input video signal at gradation levels equal to or lower than a predetermined level (optimum value of A according to 256-shade grayscale shown in figure 19, threshold for each dither pattern is zero to 10, column 12, lines 66-67) and said display whose original number of shades is represented with m bits and is equal or less than 2^m in order to artificially increase the number of shades.

As to claim 29, Ishida et al. teaches a method of processing a video signal comprising the steps of generating a plurality of dither coefficient pattern signals (dither pattern generator shown in figure 10A) according to color gradation levels (8-bit input signal for each color RGB, column 8, lines 2-3, gray scale levels in figure 19), selecting one of the dither coefficient from each pattern signal with respect to each dot matrix (selector 32/34 shown in figure 27, column 17, lines 20-22) adjusting the dither coefficients carried by the output pattern signal so that the sum total of the dither coefficients is zero (sum $A-A-A+A$ is zero , figure 15, column 11, lines 4-5) and the dither pattern generator 13 selects one of the dither patterns prepared in advance (column 10, lines 47-49), adding the dither coefficient-adjusted pattern signal to the input video signal (adder 12, figure 10A, column 10, line 50, column 12, lines 61-62) , thus outputting a video signal carrying the data to be supplied to the display panel (PDP 21 shown in figure 11).

As to claim 31, wherein the selection step comprises the step of selecting one dither coefficient for each predetermined unit of the data carried by the video signal or according to locations of the pixels on the display panel (selector selects one of the dither types, column 22, lines 50-51).

As to claim 32, wherein the pattern signals are generated so that each pattern signal carries an even number of the coefficients, addition of the coefficients in each of the two groups yielding zero when the coefficients are divided into the two groups, both groups including the same number of the coefficients (figure 15 shows groups +A and -A).

As to claim 33, Ishida et al. fails to teach dither matrix wherein each pattern signal carries an odd number of the coefficients, the coefficient located at the center of the matrix being zero. However, since figure 15 shows the sum of dither coefficients being zero and Ishida et al. discloses that any matrix is employable (column 13, lines 1-2), it is inherent in the art, in case of a (n x m) matrix where n is different from m, to easily determine value of dither coefficient at the center of matrix to keep sum of all dither coefficients being zero.

As for claim 35, Ishida et al. teach a frame is divided into six subframes SF1 to SF6 as explained with reference to FIG. 1. The lighting periods of the subframes SF1 to SF6 are determined according to powers of 2 as listed in Table 1. The lighting periods correspond to shades, or intensity or brightness levels, respectively.

Response to arguments

6. Applicant's arguments filed March 14, 2005 have been fully considered but they are not persuasive. The applicant argued that the prior art does not teach a relatively small weighting factor is given the gradation level of a pixel far from the pixel of concern which is located at the center of the matrix. In other words, Sakano teaches weighting

Art Unit: 2674

according to the location of pixels on the matrix, not according to the gradation level of an input video signal as claimed. Examiner disagrees with the applicant because the prior art, Sakano, teaches a relatively large weighting factor is given the gradation level of a pixel close to the pixel of concern, and a relatively small weighting factor is given the gradation level of a pixel far from the pixel of concern. The weighted average is effective to a relatively large size of matrix (a 16.times.16 matrix for example).

Furthermore, the applicant argued that the prior art does not teach adding coefficient signal to the input signal at gradation levels equal to or lower than a predetermined level. Examiner disagrees with the applicant because the prior art teaches said display whose original number of shades is represented with m bits and is equal or less than 2^m in order to artificially increase the number of shades (column 25, lines 43-45). The applicant needs to amend the claims to really teach away from the pertinent prior art of record.

Conclusion

7. The prior art made of record but not relied upon is pertinent to Applicant's disclosure:

US Patent Choi et al. 5,495,346

US Patent Barkans et al. 5,905,504

US Patent Rao et al. 5,640,249

US Patent Shigeta 6,008,793

US Patent Priem et al. 5,734,369

Reference Choi et al. is made of record as it discloses an element generator for a dither matrix.

Reference Barkans et al. is made of record as it discloses a system and method for dithering and quantizing image data.

Reference Rao et al. is made of record as it discloses an image processing apparatus using derived ordered dither matrix.

Reference Shigeta is made of record as it discloses a drive apparatus comprising a dithering circuit.

Reference Priem et al. is made of record as it discloses a method and apparatus for dithering images .

THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than **SIX MONTHS** from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Jean Lesperance whose telephone number is (571)
